

Startup Investment Analysis Report

Introduction

This project focuses on analyzing startup investment trends using the Shark Tank India dataset. The aim of the project is to identify funding patterns, investor activity, industry-wise investment distribution, and equity trends among startups.

Abstract

The project uses Python and Tableau to perform data cleaning, exploratory data analysis, visualization, and dashboard creation. Various charts and dashboards were developed to understand which industries received the highest investments, which investors were most active, and how startup valuations and equity percentages were related.

Objectives

- Analyze startup investment patterns
- Identify the most funded industries
- Study investor participation trends
- Visualize equity and valuation relationships
- Build an interactive Tableau dashboard

Tools and Technologies Used

- Python
- Pandas
- Matplotlib
- Seaborn
- Tableau Public
- Jupyter Notebook

Dataset Used

The project used the Shark Tank India startup investment dataset containing information about startups, industries, investment amounts, investors, equity percentages, and valuation requests.

Steps Involved in Building the Project

1. Imported the dataset into Jupyter Notebook.
2. Cleaned missing and duplicate data using Pandas.
3. Performed exploratory data analysis.
4. Created charts for industry investments, investor analysis, and equity distribution.
5. Exported cleaned data for visualization.
6. Built an interactive Tableau dashboard.
7. Generated insights and business conclusions.

Key Insights

- Technology and food startups attracted major investments.
- Certain investors participated more frequently than others.
- Higher investments were generally associated with higher equity percentages.
- Startup valuation and investment amounts showed positive trends in several industries.

Conclusion

This project successfully demonstrated how data analytics and visualization techniques can be used to analyze startup investment behavior. Python helped in data processing and analysis, while Tableau enabled interactive dashboard creation for business insights. The project improved understanding of data cleaning, visualization, and dashboard development processes.

Deliverables

- Python analysis notebook
- Tableau dashboard
- Cleaned dataset
- Project report
- Visual charts and screenshots
